These instructions are suitable for CLAS HE SYSTEM boilers :

Do not forget the Log Book!

MTS supports Benchmark, the heating industry code to ensure the correct installation, commissioning and servicing of domestic central heating systems.

To The Householder

Make sure you have a completed Log Book for your boiler. This provides a record of the commissioning of your boiler.

It contains important information about your particular installation that may be required by service engineers. The Log Book will also provide contact details for the installer should you need guidance in the use of this appliance or if there are any problems.

As with your car, your boiler will work more reliably and efficiently if regularly serviced. We recommend an annual service check. The service history of the appliance will be recorded on the Log Book.

In the unlikely event of any problems with your boiler or system you should first contact your installer. If your installer cannot resolve the problem he should telephone our national service helpline.

A charge may be made if MTS Service is called out to resolve a non-product related fault.

Your statutory rights are not affected.

To The Installer

As part of the commissioning of this appliance it is vital that the Log Book is completed and given to the Householder. Please ensure that your customer is aware of the importance of keeping the Log Book safe as a record of the installation and the appliance service history.

Please ensure that your customer is aware of the correct operation of the system, boiler and controls.

MTS recommend the use of protective clothing, when installing and working on the appliance i.e. gloves.

CUSTOMER CARE

MTS, as a leading manufacturer of domestic and commercial water heating appliances is committed to providing high quality products and a high quality after sales service.

Advice on installation or servicing can also be obtained by contacting the MTS Technical and Customer Service Departments at High Wycombe.

TECHNICAL DEPARTMENT

Tel: 0870 241 8180

Fax: 01494 459775

CUSTOMER SERVICE DEPARTMENT

Fax: 01494 459775

GUARANTEE

The manufacturer's guarantee is for 2 years from the date of purchase. The guarantee is invalidated if the appliance is not installed in accordance with the recommendations made herein or in a manner not approved by the manufacturer. To assist us in providing you with an efficient after sales service, please return the guarantee registration card enclosed with the boiler without delay.

CAUTION

In the United Kingdom, installation, start-up, adjustments and maintenance, must be performed by a competent person only, in accordance with the current Gas Safety (Installation & Use) Regulations and the instructions provided.

In the Republic of Ireland, the installation and initial start up of the appliance must be carried out by a Competent Person in accordance with the current edition of I.S.813 "Domestic Gas Installations", the current Building Regulations, reference should also be made to the current ETCI rules for electrical installation.

All CORGI registered installers carry a CORGI ID card, and have a registration number. Both should be recorded in your boiler Log Book. You can check your installer is CORGI registered by calling CORGI direct on:- (01256) 372300.

Improper installation may cause damage or injury to individuals, animals and personal property for which the manufacturer will not be held liable. To ensure efficient and safe operation it is recommended that the boiler is serviced annually by a competent person.

If it is known that a fault exists on the appliance, it must not be used until the fault has been corrected by a competent person.

This instruction booklet is especially designed for appliances installed in the UK and the Republic of Ireland

Advice for the installer

The installation and first ignition of the boiler must be performed by qualified personnel in compliance with current national regulations regarding installation, and in conformity with any requirements established by local authorities and public health organisations.

After the boiler has been installed, the installer must ensure that the end user receives the declaration of conformity and the operating manual, and should provide all necessary information as to how the boiler and the safety devices should be handled.

This appliance is designed for domestic use only.

It should be connected to a heating system and a distribution network for domestic hot water, both of which must be compatible with its performance and power levels.

The use of the appliance for purposes other than those specified is strictly forbidden. The manufacturer cannot be held responsible for any damage caused by improper, incorrect and unreasonable use of the appliance or by the failure to comply with the instructions given in this manual.

Installation, maintenance and all other interventions must be carried out in full conformity with the governing legal regulations and the instructions provided by the manufacturer. Incorrect installation can harm persons, animals and possessions; the manufacturing company shall not be held responsible for any damage caused as a result. The boiler is delivered in a carton. Once you have removed all the packaging, make sure the appliance is intact and that no parts are missing. If this is not the case, please contact your supplier.

Keep all packaging material (clips, plastic bags, polystyrene foam, etc.) out of reach of children as it may present a potential hazard.

In the event of a fault and/or malfunction, turn the appliance off, turn off the gas cock and do not attempt to repair it yourself. Contact a qualified professional instead.

Before any maintenance or repair work is performed on the boiler, make sure you have disconnected it from the electricity supply by switching the external bipolar switch to the "OFF" position and removing the fuse.

All repairs, which should only be performed using original spare parts, should be carried out by a qualified professional. Failure to comply with the above instructions could compromise the safety of the appliance and invalidate all liability on the part of the manufacturer.

In the event of any maintenance or other structural work in the immediate vicinity of the ducts or flue gas exhaust devices and their accessories, switch the appliance off by switching the external bipolar switch to the "OFF" position and shutting off the gas control valve. When the work has been completed, ask a qualified technician to check the efficiency of the ducting and the devices.

Turn the boiler off and turn the external switch "OFF" to clean the exterior parts of the appliance.

Clean using a cloth dampened with soapy water. Do not use aggressive detergents, insecticides or toxic products. If the appliance is used in full compliance with current legislation, it will operate in a safe, environmentally-friendly and cost-efficient manner.

If using kits or optional extras, make sure they are authentic.

CE labelling

The CE mark guarantees that the appliance conforms to the following directives:

- **90/396/CEE**
relating to gas appliances
- **89/336/CEE**
relating to electromagnetic compatibility
- **92/42/CEE**
relating to energy efficiency
- **73/23/CEE**
relating to electrical safety

Safety regulations

Key to symbols:

- ⚠ Failure to comply with this warning implies the risk of personal injury, in some circumstances even fatal
- ⚠ Failure to comply with this warning implies the risk of damage, in some circumstances even serious, to property, plants or animals.

Install the appliance on a solid wall which is not subject to vibration.

- ⚠ Noisiness during operation.
When drilling holes in the wall for installation purposes, take care not to damage any electrical wiring or existing piping.
- ⚠ ⚠ Electrocutation caused by contact with live wires. Explosions, fires or intoxication caused by gas leaking from damaged piping. Damage to existing installations. Flooding caused by water leaking from damaged piping.
Perform all electrical connections using wires which have a suitable section.
- ⚠ Fire caused by overheating due to electrical current passing through undersized cables.
Protect all connection pipes and wires in order to prevent them from being damaged.
- ⚠ ⚠ Electrocutation caused by contact with live wires. Explosions, fires or intoxication caused by gas leaking from damaged piping. Flooding caused by water leaking from damaged piping.
Make sure the installation site and any systems to which the appliance must be connected comply with the applicable norms in force.
- ⚠ ⚠ Electrocutation caused by contact with live wires which have been installed incorrectly. Damage to the appliance caused by improper operating conditions.
Use suitable manual tools and equipment (make sure in particular that the tool is not worn out and that its handle is fixed properly); use them correctly and make sure they do not fall from a height. Replace them once you have finished using them.
- ⚠ ⚠ Personal injury from the falling splinters or fragments, inhalation of dust, shocks, cuts, pricks and abrasions. Damage to the appliance or surrounding objects caused by falling splinters, knocks and incisions.
Use electrical equipment suitable for its intended use (in particular, make sure that the power supply cable and plug are intact and that the parts featuring rotary or reciprocating motions are fastened correctly); use this equipment correctly; do not obstruct passageways with the power supply cable, make sure no equipment could fall from a height. Disconnect it and replace it safely after use.
- ⚠ ⚠ Personal injury caused by falling splinters or fragments, inhalation of dust, knocks, cuts, puncture wounds, abrasions, noise and vibration. Damage to the appliance or surrounding objects caused by falling splinters, knocks and incisions.
Make sure any portable ladders are positioned securely, that they are suitably strong and that the steps are intact and not slippery and do not wobble when someone climbs them. Ensure someone provides supervision at all times.
- ⚠ Personal injury caused by falling from a height or cuts (stepladders shutting accidentally).
Make sure any rolling ladders are positioned securely, that they are suitably strong, that the steps are intact

and not slippery and that the ladders are fitted with handrails on either side of the ladder and parapets on the landing.

- ⚠ Personal injury caused by falling from a height.
During all work carried out at a certain height (generally with a difference in height of more than two metres), make sure that parapets are used to surround the work area or that individual harnesses are used to prevent falls. The space where any accidental fall may occur should be free from dangerous obstacles, and any impact upon falling should be cushioned by semi-rigid or deformable surfaces.
- ⚠ Personal injury caused by falling from a height.
Make sure the workplace has suitable hygiene and sanitary conditions in terms of lighting, ventilation and solidity of the structures.
- ⚠ Personal injury caused by knocks, stumbling etc.
Protect the appliance and all areas in the vicinity of the work place using suitable material.
- ⚠ Damage to the appliance or surrounding objects caused by falling splinters, knocks and incisions.
Handle the appliance with suitable protection and with care.
- ⚠ Damage to the appliance or surrounding objects from shocks, knocks, incisions and squashing.
During all work procedures, wear individual protective clothing and equipment.
- ⚠ Personal injury caused by electrocutation, falling splinters or fragments, inhalation of dust, shocks, cuts, puncture wounds, abrasions, noise and vibration.
Place all debris and equipment in such a way as to make movement easy and safe, avoiding the formation of any piles which could yield or collapse.
- ⚠ Damage to the appliance or surrounding objects from shocks, knocks, incisions and squashing.
All operations inside the appliance must be performed with the necessary caution in order to avoid abrupt contact with sharp parts.
- ⚠ Personal injury caused by cuts, puncture wounds and abrasions.
Reset all the safety and control functions affected by any work performed on the appliance and make sure they operate correctly before restarting the appliance.
- ⚠ ⚠ Explosions, fires or intoxication caused by gas leaks or an incorrect flue gas exhaust. Damage or shutdown of the appliance caused by out-of-control operation.
Before handling, empty all components that may contain hot water, carrying out any bleeding if necessary.
- ⚠ Personal injury caused by burns.
Descale the components, in accordance with the instructions provided on the safety data sheet of the product used, airing the room, wearing protective clothing, avoid mixing different products, and protect the appliance and surrounding objects.
- ⚠ ⚠ Personal injury caused by acidic substances coming into contact with skin or eyes; inhaling or swallowing harmful chemical agents. Damage to the appliance or surrounding objects due to corrosion caused by acidic substances.
If you detect a smell of burning or smoke, keep clear of the appliance, disconnect it from the electricity supply, open all windows and contact the technician.
- ⚠ Personal injury caused by burns, smoke inhalation, intoxication.

Reference Standards

In the United Kingdom, the installation and initial start-up of the boiler must be by a CORGI registered installer in accordance with the installation standards currently in effect, as well as with any and all local health and safety standards i.e. CORGI.

In the Republic of Ireland the installation and initial start-up of the appliance must be carried out by a Competent Person in accordance with the current edition of I.S.813 "Domestic Gas Installations" and the current Building Regulations, reference should also be made to the current ETCI rules for electricia installation.

The installation of this appliance must be in accordance with the relevant requirements of the Local Building Regulations, the current I.E.E. Wiring Regulations, the by-laws of the local authority, in Scotland, in accordance with the Building Standards (Scotland) Regulation and Health and Safety document No. 635, "Electricity at Work Regulations 1989" and in the Republic of Ireland with the curelt edition of I.S. 813 and the Local Building Regulations (IE).

C.O.S.H.H.

Materials used in the manufacture of this appliance are non-hazardous and no special precautions are required when servicing.

Codes of Practive

Installation should also comply with the following British Standards Code of Practice:

BS 7593:1992	Treatment of water in domestic hot water central heating systems
BS 5546:1990	Installation of hot water supplies for domestic purposes
BS 5440-1:2000	Flues
BS 5440-2:2000	Air supply
BS 5449:1990	Forced ciculation hot water systems
BS 6798:2000	Installation of gas fired hot water boilers of rated input not exceeding 70kW
BS 6891:1989	Installation of low pressure gas pipes up to 28mm
BS 7671:2001	IEE Wiring Regulations
BS 4814:1990	Specification for expansion vessels
BS 5482:1994	Installation of L.P.G.

and in the Republic of Ireland in accordancce with the following codes of practice:

I.S. 813 Domestic Gas Installations

Avoid installing the boiler where the air inlet can be polluted by checmical products such as chlorine (swimming pool area), or ammonia (hair dresser), or alkaalin products (launderette).

Flue

Detailed information on flue assembly can be found in the "Connecting the Flue" section.

The boiler must be installed so that the flue terminal is exposed to the free passage of external air at all times and must not be installed in a place likely to cause nuisance. It must not be allowed to discharge into another room or space such as an outhouse or closed lean-to.

Condensing boilers have a tendency to form a plume of water vapour from the flue terminal due to the low temperature of the flue gasses. The terminal should therefore be located with

due regard for the damage or discolouration that may occur to building within the vicinity and consideration must also be given to adjacent boundaries, openable windows should also be taken into consideration when siting the flue.

The minimum acceptable clearances are shown below:

- A Directly below an opening, window, etc	300 mm
- B Horizontally to an opening, window, etc	300 mm
- C Below gutters, soils pipes or drain pipes	75 mm
- D Below eaves	200 mm
- E From vertical drain pipe or soil pipe	75 mm
- F From internal or external corner	300 mm
- G Above ground, roof or balcony level	300 mm
- H From a surface facing the terminal	2500 mm
- I From a terminal facing a terminal	2500 mm
- J Vertically from a terminal on the same wall	1500 mm
- K Horizontally from an terminal on the same wall	300 mm
- L Fixed by vertical flue terminal	

NOTE: THE FLUE MUST NOT BE INSTALLED IN A PLACE LIKELY TO CAUSE A NUISANCE

It may be necessary to protect the terminal with a guard, if this is the case it will be necessary to purchase a stainless steel terminal guard. Reference should be made to the Building Regulations for guidance.

Ventilation

The room in which the boiler is installed does not require specific ventilation. If the boiler is installed in a cupboard or compartment ventilation is not required for cooling purposes.

Gas Supply

The gas installation and soundness testing must be in accordance with the requirements of BS6891. Ensure that the pipe size is adequate for demand including other gas appliances on the same supply.

Electrical Supply

The appliance requires an earthed 230V - 50 Hz supply and must be in accordance with current I.E.E. regulations. It must also be possible to be able to completely isolate the appliance electrically. Connection should be via a 3 amp double pole fused isolating switch with contact separation of at least 3mm on both poles. Alternatively, a fused 3 Amp, 3 pin plug and unswitched socket may be used, provided it is not used in a room containing a bath or shower, it. It should only supply the appliance.

installation

Water Supply

The boiler is suitable for sealed systems only. The maximum working pressure for the appliance is 3 bar. All fittings and pipework for the appliance should be of the same standard.

Flushing and Water Treatment

The boiler is equipped with a stainless steel heat exchanger.

The detailed recommendations for water treatment are given in BS 7593:1992 (Treatment of water in domestic hot water central heating systems); the following notes are given for general guidance;

If the boiler is installed on an existing system, any unsuitable additives must be removed.

Under no circumstances should the boiler be fired before the system has been thoroughly flushed; the flushing procedure must be in line with BS 7593:1992.

We highly recommend the use of a flushing detergent appropriate for the metals used in the circuit. These include cleansers produced by Fernox BetzDearbon, whose function is to dissolve any foreign matter that may be in the system;

In hard water areas or where large quantities of water are in the system the treatment of water to prevent premature scaling of the main exchanger is necessary.

The formation of scale strongly compromises the efficiency of the thermic exchanger because small areas of scale cause a high increase of the temperature of the metallic walls and therefore add to the thermal stress of the heat exchanger.

Demineralised water is more aggressive so in this situation it is necessary to treat the water with an appropriate corrosion inhibitor.

Any treatment of water by additives in the system for frost protection or for corrosion inhibition has to be absolutely suitable for all metals used in the circuit.

The use of a corrosion inhibitor in the sysem such as Fernox MB-1, BetzDearborn Sentinel X100 or Fernox System Inhibitor is recommended to prevent corrosion (sludge) damaging the boiler and system;

If anti-freeze substances are to be used in the system, check carefully that they are compatible with the metals used in the circuit.

MTS suggests the use of suitable anti-freeze products such as Fernox ALPHI 11, which will prevent rust and incrustation taking place.

Preiodically check the pH balance of the water/anti-freeze mixture of the boiler circuit and replace it when the amount measured is out of the range stipulated by the manufacturer ($7 < \text{pH} < 8$).

DO NOT MIX DIFFERENT TYPES OF ANTI-FREEZE

In under-floor systems, the use of plastic pipes without protection against penetration of oxygen through the walls can cause corrosion of the systems metal parts (metal piping, boiler etc), through the formation of oxides and bacterial agents.

To prevent this problem it is necessary to use pipes with an "oxygen proof barrier", in accordance with standards DIN 4726/4729. **If pipes of this kind are not used, keep the system separate by installing heat exchangers of those with a specific system water treatment.**

IMPORTANT

Failure to carry out the water treatment procedure will invalidate the appliance guarantee.

System Controls

The boiler is electrically controlled and is suitable for most modern electronic time and temperature controls. The addition of such external controls can be beneficial to the efficient operation of the system. The boiler connections for external contols are 12V DC and so only controls of 12V DC that have voltage free contacts should be used. (page 24).

MTS supply a range of wired and wireless system controls. Contact your supplier for more details.

Location

The boiler can be installed on any suitable internal wall (suitable sound proofing may be required when installing onto a stud partition wall). Provision must be made to allow for the correct routing of the flue and siting of the terminal to allow the safe and efficient removal of the flue products. A compartment or cupboard may be used provided that it has been built or modified for this purpose. It is not necessary to provide permanent ventilation for cooling purposes. Detailed recommendations are given in BS 5440 Part 2. If it is proposed that it is to be installed in a timber framed building then reference should be made to British Gas Document DM2, or advice sought from CORGI.

Where a room sealed appliance is installed in a room containing a bath or shower, the appliance and any electrical switch or appliance control, utilising mains electricity should be situated specifically in accordance with current IEE Wiring Regulations.

For unusual locations, special procedures may be necessary. **BS 6798:2000** gives detailed guidance on this aspect.

Codensate Discharge

The condensate discharge hose from the boiler must have a continuous fall of 2.5° and must be inserted by at least 50mm into a suitable acid resistant pipe - e.g. plastic waste or overflow pipe. The condensate discharge pipe must have a minimum diameter of 22mm, must have a continuous fall and preferably be installed and terminated to prevent freezing.

The discharge pipe must be terminated in a suitable position:

- i) Connecting into an internal soil stack (at least 450mm above the invert of the stack). A trap giving a water seal of at least 75mm must be incorporated into the pipe run, there also must be an air beak upstream of the trap.
- ii) Connecting into the waste system of the building such as a washing maching or sink trap. The connection must be upstream of the washing machine/sink. If the connection is down stream of if the waste trap then an additional trap giving a minimum water seal of 75mm and an air break must be incorporated in the pipe run, as above.
- iii) Terminating into a gully, below the grid level but above the water level

iv) Into a soakaway

Note: If any condensate pipework is to be installed externally then it should be kept to a minimum and be insulated with a waterproof insulation and have a continuous fall. The total length of external pipe used should not exceed 3 metres.

Some examples of the type of condensate terminations can be found below.

1. Internal termination of condensate drainage pipe to internal stack.

2. External termination of condensate drainage pipe via internal discharge branch (e.g. sink waste) and condensate siphon.

3. External termination of condensate drainage pipe via internal discharge branch (e.g. sink waste - proprietary fitting).

External termination of condensate drainage pipe via condensate siphon

installation

Installing the Boiler

Please check that you are familiar with the installation requirement before commencing work (pages 7 - 11).

The installation accessories described in the following list are included in the boiler packaging:

- Hanging bracket
- A paper template (showing the dimensions of the boiler with 5 mm side clearances)
- Connection valves (Compression)
- Screws and washers
- Filling loop
- Installation, Servicing and Operating Instructions
- Flue gasket

Method of positioning the boiler on the wall

The paper template can be used to ensure the correct positioning of kitchen cabinets etc.

The paper template has to be fixed to the wall and used to locate the position of the hanging bracket and the centre for the flue hole.

Drill and plug the wall and secure the hanging bracket using the screws provided. Remove the boiler from its packaging and remove the front casing panel.

Place the boiler on the hanging bracket.

NOTE: THE APPLIANCE MUST NOT BE FITTED ON A COMBUSTIBLE WALL SURFACE.

Connecting the Boiler to the System

- Remove the boiler casing as described on page 13;
- Remove the caps and connect the valves to the boiler using the washers provided;
- 3 x fibre washers for the CH flow and return and cold water inlet

Safety Valve Discharge and Condense Outlet

The pressure relief valve tube is made of copper. It should terminate below the boiler safely outside the premises. Care should be taken that it does not terminate over an entrance or window or where a discharge of heated water could endanger occupants or passers by.

Fill the central heating and DHW system and bleed air from the system as described in the Commissioning instructions (page 26).

The system should be carefully checked for leaks, as frequent refilling could cause premature system corrosion or unnecessary scaling of the heat exchanger. The pipe from the trap should be connected to a drain as described in the relevant regulations.

Pay special attention not to bend the condensate silicone drain pipe in such a way as to interrupt the flow. Please only use drain pipe material compatible with condensate products (refer to BS 6798:2000).

The condensate flow can reach 2 litres/hour because of the acidity of the condensate products (Ph close to 2), take care before operation.

See page 11 for condensate discharge possibilities.

Gas connection

Make sure, using the labels on the packaging and the data plate on the appliance itself, that the boiler is in the correct country and that the gas category for which the boiler was designed corresponds to one of the categories available in the country where it will be used.

The gas supply piping must be created and measured out in compliance with specific legal requirements and in accordance with the maximum power of the boiler; you should also make sure that the shut-off valve is the right size and that it is connected correctly.

Check that the supplied gas corresponds to the type of gas for which the boiler was designed (see the data plate located on the appliance itself).

It is also important to check that the pressure of the gas (methane or LPG) you will be using to feed the boiler is suitable, because if it is insufficient the power may be reduced, causing inconvenience for the user.

Water connection

The illustration shows the connections for the water and gas attachments of the boiler. See valves configuration on page 12.

Check that the maximum water mains pressure does not exceed 6 bar; if it does, a pressure reducing valve must be installed.

For the measuring of the pipes and of the heating bodies in the heating system, the residual head value should be calculated as a function of the requested flow rate, in accordance with the values shown in the circulation pump graph on page 14.

A. Central heating Flow
C. Gas Inlet
D. Cold Mains Connection
E. Central Heating Return

F. Safety Valve Discharge
H. Drain Valve
I. Drain condensate

Instructions for opening the casing and performing an internal inspection

Before performing any work on the boiler, first disconnect it from the electrical power supply using the external bipolar switch removing the fuse and shutting off the gas valve.

To access the inside of the boiler, the following is necessary:

1. Remove the casing by unhooking it from the control panel (a)
2. Loosen the two screws on the front casing (b), pull it forwards and unhook it from the upper pins (c)
3. Lower the control panel (d)
4. Unhook the two clips on the combustion chamber panel and lift off (e).

installation

To calculate the size of the heating installation, refer to the "Available pressure" graph below.

Graph representing the available circulation pump pressure $\Delta T 20^\circ\text{C}$

⚠ Before the first time the equipment is used, the trap must be filled with water. To do this, add approximately 1/4 litre of water via the flue outlet before fitting the flue system, or unscrew the cap on the trap positioned underneath the boiler, fill it with water and refit it

⚠ Warning! insufficient water in the trap can temporarily cause the flue gas to be expelled into the surrounding ambient air

Underfloor heating

For appliances with underfloor heating, fit a safety thermostat onto the underfloor heating outlet. For the electrical connection of the thermostat see the section on "Electrical connections - page 24".

If the outlet temperature is too high, the boiler will stop both domestic hot water and the heating production and the error code 1 16 "floor thermostat contact open" will appear on the display. The boiler will restart when the thermostat is closed during automatic resetting.

If the thermostat cannot be installed, the underfloor heating equipment must be protected by a thermostatic valve, or by a by-pass to prevent the floor from reaching too high a temperature.

Water circuit diagram

Connecting the Flue

Flue System

The provision for satisfactory flue termination must be made as described in BS 5440-1.

The appliance must be installed so that the flue terminal is exposed to outdoor air.

The terminal must not discharge into another room or space such as an outhouse or lean-to.

It is important that the position of the terminal allows a free passage of air across it at all times.

The terminal should be located with due regard for the damage or discolouration that might occur on buildings in the vicinity, it must also be located in a place not likely to cause nuisance. In cold or humid weather water vapour may condense on leaving the flue terminal.

The effect of such "steaming" must be considered.

If the terminal is less than 2.1 metres above a balcony, above ground or above a flat roof to which people have access, then a suitable stainless steel terminal guard must be fitted.

The minimum acceptable spacing from the terminal to obstructions and ventilation openings are specified in Fig. 1.

Fig. 1

- A Directly below an opening, window, etc	300 mm
- B Horizontally to an opening, window, etc	300 mm
- C Below gutters, soils pipes or drain pipes	75 mm
- D Below eaves	200 mm
- E From vertical drain pipe or soil pipe	75 mm
- F From internal or external corner	300 mm
- G Above ground, roof or balcony level	300 mm
- H From a surface facing the terminal	2500 mm
- I From a terminal facing a terminal	2500 mm
- J Vertically from a terminal on the same wall	1500 mm
- K Horizontally from an terminal on the same wall	300 mm
- L Fixed by vertical flue terminal	

Fig. 2

installation

Warning

The exhaust gas ducts must not be in contact with or close to inflammable material and must not pass through building structures or walls made of inflammable material. When replacing an old appliance, the flue system must be changed.

Important

Ensure that the flue is not blocked.
Ensure that the flue is supported and assembled in accordance with these instructions.

Fitting the Coaxial Flue

(Ø 60 / 100 Horizontal)

Contents:

- 1x Silicone O-Ring (60mm)
- 1x Elbow (90°)
- 2x Wall Seals (Internal & External)
- 1x Flue Pipe including Terminal (1 metre - 60/100)
- 2x Flue Clamps
- 4x Screws
- 2x Seals

Once the boiler has been positioned on the wall, fit the rubber flue seal into the internal flue turret (see Fig.2.),

Insert the elbow into the socket and rotate to the required position. note: It is possible to rotate the elbow 360° on its vertical axis.

Using the flue clamp, seals and screws supplied (Fig 4) secure the elbow to the boiler.

The 1 metre horizontal flue kit (3318073) supplied is suitable for an exact X dimension of 753mm.

Measure the distance from the face of the external wall to the face of the flue elbow (X - Fig 2), this figure must now be subtracted from 753mm, you now have the total amount to be cut from the plain end of the flue.

Draw a circle around the outer flue and cut the flue to the required length taking care not to cut the inner flue, next cut the inner flue ensuring that the length between the inner and outer flue is maintained. (Fig 4).

e.g.

$$X = 555\text{mm}$$

$753 - 555 = 198\text{mm}$ (Length to be cut from the plain end of the flue).

Once cut to the required length, ensure that the flue is free from burrs and reassemble the flue. If fitting the flue from inside of the building attach the grey outer wall seal to the flue terminal and push the flue through the hole, once the wall seal has passed through the hole, pull the flue back until the seal is flush with the wall. Alternatively, the flue can be installed from outside of the building, the grey outer seal being fitted last.

Should the flue require extending, the flue connections are push fit, however, one flue bracket should be used to secure each metre of flue.

Note: See table for maximum and minimum flue runs.

Fitting the 5" Flue

(Ø 80 / 125 Horizontal/vertical)

Once the boiler has been positioned on the wall, it is necessary to insert the Ø80/125 adaptor (Fig. 5) for both horizontal and vertical flue runs into the boiler flue socket (not supplied with flue kit - Part No 3318095).

Push the adaptor onto the boiler's flue connection, grease the seals then add extensions or elbows as required, secure the adaptor, using the clamp and screws provided.

To fit extensions or elbows it is first necessary to ensure that the lip seal is fitted correctly into the inner flue, once verified, it is simply necessary to push them together, no clamps are necessary to secure the flue components.

Before proceeding to fit the flue, ensure that the maximum flue length has not been exceeded (See the tables) and that all elbows and bends have been taken into consideration, the maximum flue length is 10 metres, for each additional 90° elbow 1 metre must be subtracted from the total flue length, and for each 45° 0.5 metres must be subtracted from the total flue length (the height of the vertical adaptor and a 45° bend can be seen in Fig. 6 and a 90° bend in Fig. 7).

Note: DO NOT cut the vertical flue kit.

Fitting the Coaxial Flue (Ø 60 / 100 Vertical)

Fig. 7

Fig. 8

Note: See table for maximum and minimum flue runs.

Contents:

- 1x Silicone O-Ring (60mm)
- 1x Conical Adaptor (60/100mm)
- 1x Vertical Flue Kit (80/125mm)
- 3x Screws

The vertical flue kit is supplied with a specially designed weather proof terminal fitted, it can be used either with a flat roof or a pitched roof.

The Vertical flue kits useable lengths with the pitched roof flashings are indicated in Fig. 7.

Before proceeding to fit the flue, ensure that the maximum flue length has not been exceeded (See the tables) and that all elbows and bends have been taken into consideration, the maximum flue length is see table, for each additional 90° elbow 1 metre must be subtracted from the total flue length, and for each 45° 0.5 metres must be subtracted from the total flue length (the height of the vertical adaptor and a 45° bend can be seen in Fig. 8).

Mark the position of the flue hole in the ceiling and/or roof (see Fig. 7 for distance from wall to the centre of the flue).

Cut a 130mm diameter hole through the ceiling and/or roof and fit the flashing plate to the roof.

DO NOT cut the vertical flue kit.

To connect the vertical flue kit directly to the boiler, place the vertical starter kit (Part No. 3318079) (see Fig. 7) onto the exhaust manifold and secure with the clamp, fit the vertical adaptor onto the vertical starter kit (note: there is no need to use a clamp to secure this as it is a push fit connection), the vertical flue kit must then be inserted through the roof flashing, this will ensure that the correct clearance above the roof is provided as the terminal is a fixed height.

Should extensions be required, they are available in 1 metre (Part No. 3318077), 500mm (Part No. 3318078) and 160mm lengths, they must be connected directly to the vertical starter kit before connecting the adaptor to allow the vertical flue kit to be fitted. In the event that extension pieces need to be shortened, they must only be cut at the male end and it must be ensured that the inner and outer flue remain flush.

When utilising the vertical flue system, action must be taken to ensure that the flue is supported adequately to prevent the weight being transferred to the appliance flue connection by using 1 flue bracket per extension.

When the flue passes through a ceiling or wooden floor, there must be an air gap of 25mm between any part of the flue system and any combustible material. The use of a ceiling plate will facilitate this. Also when the flue passes from one room to another a fire stop must be fitted to prevent the passage of smoke or fire, irrespective of the structural material through which the flue passes.

Fitting the Twin Pipe (Ø80 / 80)

Note: See table for maximum and minimum flue runs.

Where it is not possible to terminate the flue within the distance permitted for coaxial flues, the twin flue pipe can be used by fitting a special adaptor to the flue connector and using the aperture for the air intake located on top of the combustion chamber.

Always ensure that the flue is adequately supported, using one flue bracket per extension and avoiding low points. (MTS supply suitable clamps as Part No. 705778).

To utilise the air intake it is necessary to:

- 1) Take the air intake cover off the top of the appliance
- 2) Assemble the flange on the header supplied with the boiler
- 3) Insert the header on the tube or the elbow up until the lower stop (you do not have to use the washer).
- 4) Insert the elbow/header in the boiler air intake hole and fasten it with screws.

The twin flue pipes can be fitted with or without additional elbows and need no clamps, simply ensure that the red o-ring is inserted in the female end of the flue pipe and push the extension piece fully into the previous section of flue pipe or elbow, check that the o-ring is not dislodged when assembling the flue (greasing the seal will aid assembly).

Twin pipe can also be converted back to Coaxial flue to enable vertical termination with a coaxial kit by using the pipe bridge (Twin - Coaxial Adaptor - Part No. 3318089). When running the twin flue pipe vertically.

It is not possible to terminate concentrically horizontally. Termination is only possible with separate air and exhaust terminals.

When siting the twin flue pipe, the air intake and exhaust terminals must terminate on the same wall, the centres of the terminals must be a minimum of 280 mm apart and the air intake must not be sited above the exhaust terminal (refer to Fig. 10). The air intake pipe can be run horizontally, however, the terminal and the final 1 metre of flue must be installed either horizontally or with a slight fall away from the boiler to avoid rain ingress.

It is also strongly recommended that the air intake pipe run be constructed of insulated pipe to prevent condense forming on the outside of the tube.

The maximum permissible flue length for twin flue is dependent on the type of run used (see table on page 21).

For further information relating to flue runs not illustrated, please contact the Technical Department on 0870 241 8180.

Fig. 9

Fig. 10

For coaxial systems, the maximum development value, mentioned in the table below also takes into account an elbow.
For twin flue systems the maximum development value, mentioned in the table includes the exhaust gas/air intake terminal.

Type 5 outlets should respect the following instructions:

- 1- Use the same \varnothing 80 mm flue pipes for the air intakes and exhaust gas ducts.
- 2- If you need to insert elbows in the air intake and exhaust gas ducts, you should consider for each one the equivalent length to be included in the calculation of developed length.
- 3- The exhaust gas duct should jut above the roof by at least 0.5 m.
- 4- The intake and exhaust gas ducts in Type C13 + C53 must be installed on the same wall, or where the exhaust is vertical and the air intake horizontal, the terminals must be on the same side of the building.

Table of flue gas exhaust duct lengths

COAXIAL SYSTEM	FLUE TYPE		MAX LENGTH	DIAMETER of PIPE	Length equivalency for	
	C13 Flue gas exhaust and air suction duct through external wall in the same range of pressure	18 kW	14 m 42 m	60/100 80/125	45° elbow	0.5m
					90° elbow	1.0m
		24 kW	12 m 36 m	60/100 80/125	45° elbow	0.5m
					90° elbow	1.0m
		30 kW	10 m 30 m	60/100 80/125	45° elbow	0.5m
					90° elbow	1.0m
	C33 Flue gas exhaust and air suction duct from outside with roof terminal in the same range of pressure	18 kW	0 m 49 m	60/100 80/125	45° elbow	0.5m
					90° elbow	1.0m
		24 kW	0 m 42 m	60/100 80/125	45° elbow	0.5m
					90° elbow	1.0m
		30 kW	0 m 35 m	60/100 80/125	45° elbow	0.5m
					90° elbow	1.0m
	C43 Individual or shared flue gas exhaust and air suction through flue ducting built into the building	18 kW	14 m 0 m	60/100 80/125		
		24 kW	12 m 0 m	60/100 80/125		
		30 kW	10 m 0 m	60/100 80/125		

TWIN-PIPE SYSTEM	FLUE TYPE		MAX LENGTH	DIAMETER of PIPE	Length equivalency for		
	C13 Flue gas exhaust and air suction duct through external wall in the same range of pressure	18 kW	42 m (S1=S2)	80/80	45° elbow	1.4m	
		24 kW	36 m (S1=S2)		90° elbow	2.2 m	
		30 kW	30 m (S1=S2)		45° elbow	1.4m	
					90° elbow	2.2 m	
	C 33 Flue gas exhaust and air suction duct from outside with roof terminal in the same range of pressure	18 kW	70 m (S1=S2)	80/80	45° elbow	1.4m	
		24 kW	60 m (S1=S2)		90° elbow	2.2 m	
		30 kW	50 m (S1=S2)		45° elbow	1.4m	
					90° elbow	2.2 m	
	C53 Flue gas exhaust leading outside and air suction duct through external wall not in the same range of pressure	18 kW	49 m (S1+S2)	80/80	45° elbow	1.4m	
		24 kW	84 m (S1+S2)		90° elbow	2.2 m	
		30 kW	70 m (S1+S2)		45° elbow	1.4m	
					90° elbow	2.2 m	

S1 = Air intake S2 = Flue gas exhaust

S1 = S2 - Air intake and flue gas exhaust equal lengths

S1 + S2 - Air intake and flue gas exhaust unequal lengths

WARNING

Before performing any work on the boiler, first disconnect it from the electrical power supply using the external bipolar switch and remove the fuse.

Electrical connections

For increased safety, ask a qualified technician to perform a thorough check of the electrical system.

The manufacturer is not responsible for any damage caused by the lack of a suitable earthing system or by the malfunctioning of the electricity mains supply.

Make sure that the system is able to withstand the maximum power absorbed by the boiler (this is indicated on the appliance data plate). Check that the section of the wires is suitable and is not less 1.5 mm²

The appliance must be connected to an efficient earthing system if it is to operate correctly.

The power supply cable must be connected to a 230V-50Hz network, where the L-N poles and the earth connection are all respected.

Important!

In the event that the power supply cable must be changed, replace it with one with the same specifications.

Power supply cable

Important!

Connection to the electricity mains supply must be performed using a fixed connection (not with a mobile plug) and a bipolar switch with a minimum contact opening of 3 mm must be fitted.

The use of multiplugs, extension leads or adaptors is strictly prohibited.

It is strictly forbidden to use the piping from the hydraulic, heating and gas systems for the appliance earthing connection.

The boiler is not protected against the effects caused by lightning. If the mains fuses need to be replaced, use 2A rapid fuses.

Peripheral unit connection

To access peripheral unit connections carry out the following steps:

- Disconnect the boiler from the power supply
- Remove the casing by unhooking it from the instrument panel
- Rotate the control panel while pulling it forwards
- Unscrew the three screws on the back cover of the instrument panel
- Unhook the right side clip and the right front clip; then lift the flap

The terminal block (see figure) may be accessed in order to connect:

Outdoor sensor

Room thermostat 1

Optional P.C.B.s can also be installed for further accessories:

BUS P.C.B.

Clima Manager

Modulating Room Sensor

Programmable Room Thermostat

Outdoor Sensor

Caution!

For the connection and positioning of the wires belonging to optional peripheral units, please refer to the installation manuals of these units.

installation

Room thermostat connection

- Introduce the thermostat wire
- Loosen the cable clamp using a screwdriver and insert the wires leading from the room thermostat one at a time.
- Connect the wires to the terminals as indicated in the figure below, removing the link
- Make sure that they are well connected and that they are not subject to stress when the control panel lid is opened or closed
- Close the flap again, then replace the control panel cover and the front casing.

Room Thermostat

Connector TA on PCB
(low voltage switching)

Outdoor sensor connection

- Introduce the outdoor sensor wires
- Loosen the cable clamp using a screwdriver and insert the wires leading from the outdoor sensor one at a time.
- Connect the wires to the terminals as indicated in the figure below;
- Make sure that they are well connected and that they are not subject to stress when the control panel lid is opened or closed;
- Close the flap again, then replace the control panel cover and the front casing.
- Refer to page 39 for setting the parameters when using the outdoor sensor.

Outdoor Sensor

Connector SE on PCB

NOTE: WHEN CONNECTING THE BOILER TO EXTERNAL CONTROLS, DO NOT RUN **240V** CABLES AND CABLES FOR SWITCHING CIRCUITS (WHICH ARE LOW VOLTAGE) TOGETHER, USE SEPERATE CABLES TO PREVENT INDUCED VOLTAGE ON THE LOW VOLTAGE CIRCUITS.

The boiler can be connected to a central heating system that uses two zone valves to allow connection to an indirect storage cylinder.

There are two wiring diagrams shown, one for the connection to an Unvented Cylinder and one for connection to an open vented cylinder.

In both cases the boiler connection is shown as TA1.

When connecting the boiler to an external cylinder do not run 240V cables and the cables for the room terminal together, use separate cables to prevent induced voltage on the low voltage switching circuit.

NOTE: THE USE OF A 'Y' PLAN SYSTEM IS NOT POSSIBLE WITH THE **CLAS HE SYSTEM** BOILER DUE TO THE LOW VOLTAGE SWITCHING OF THE APPLIANCE UNLESS SUITABLE RELAY CONTROLS ARE USED.

Important!!

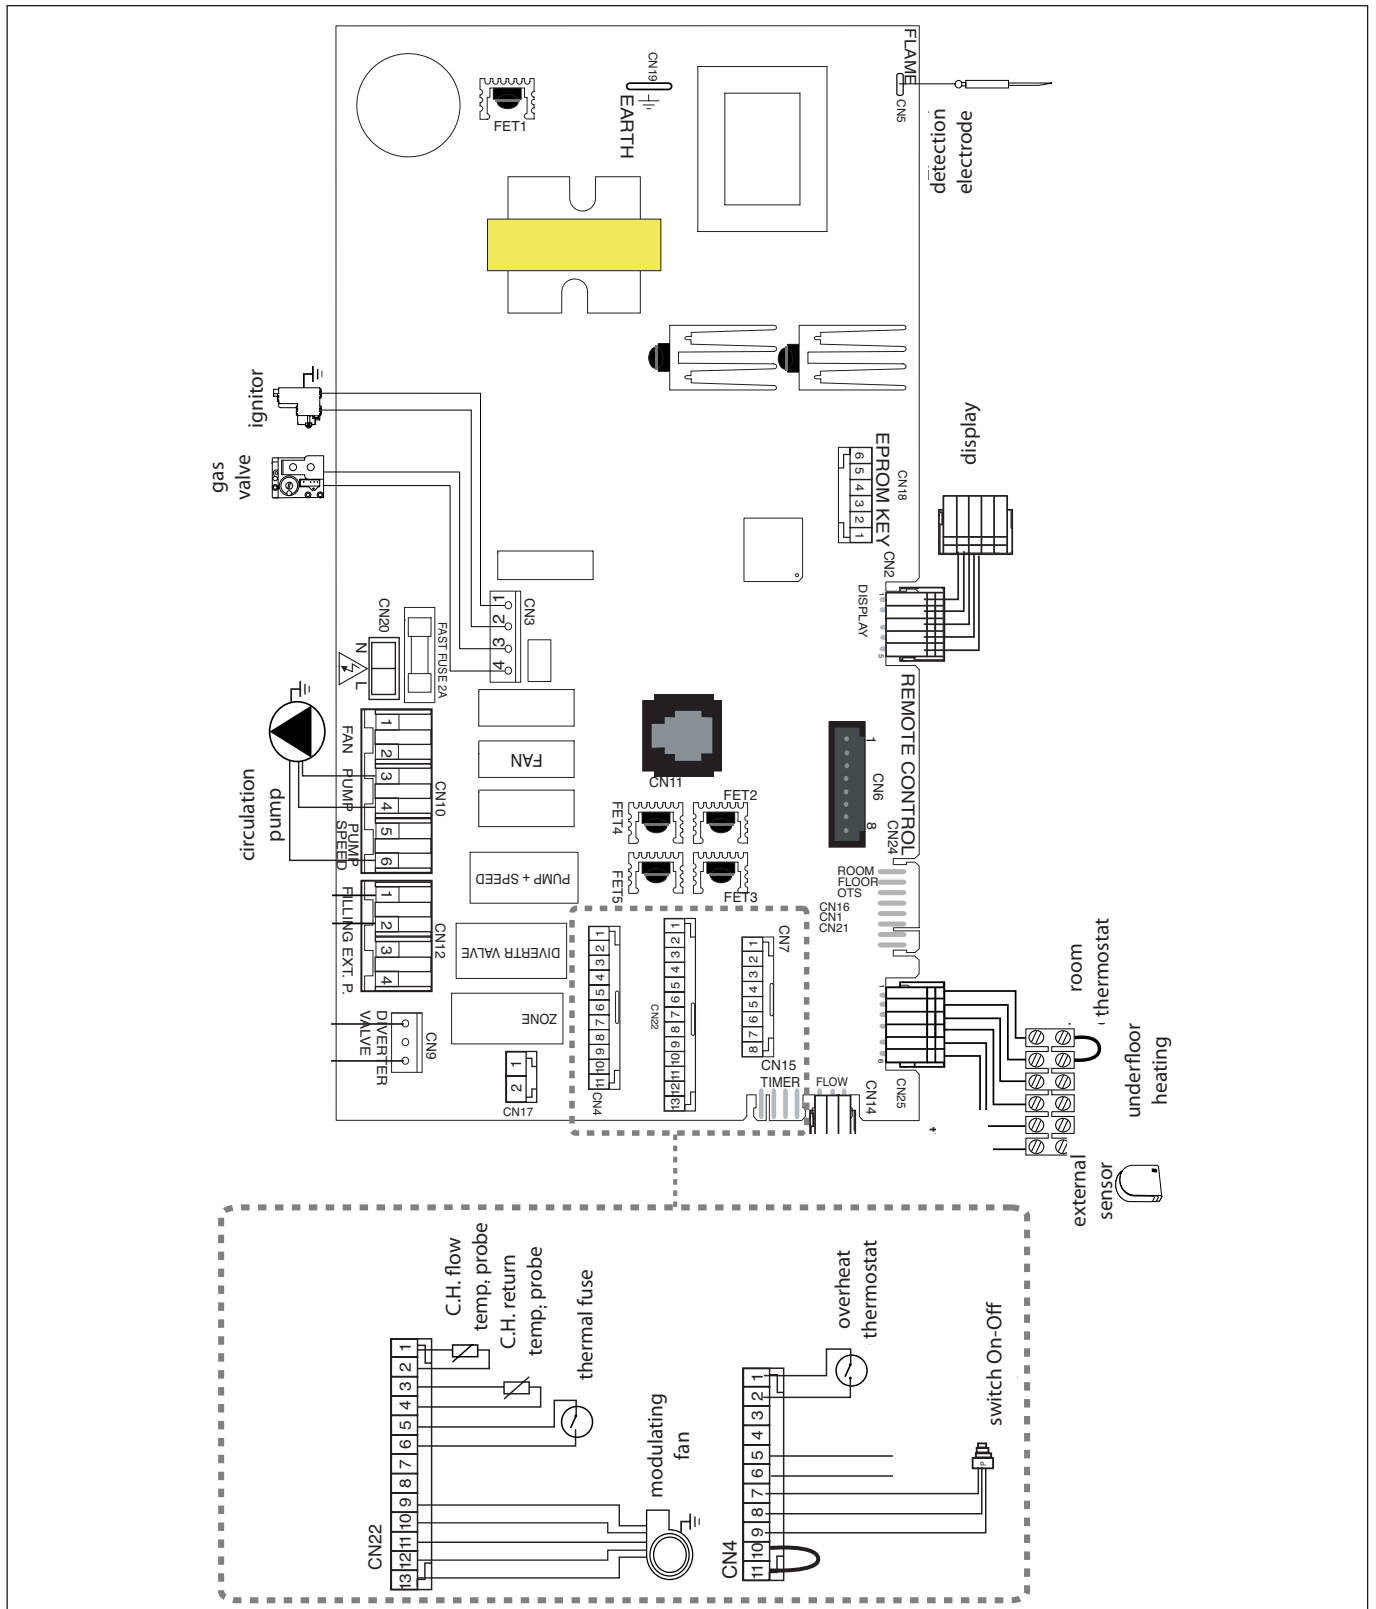

Ensure that a balancing valve is fitted on the cylinder return and balanced correctly at commissioning stage.

Electrical diagram

For increased safety, ask a qualified technician to perform a thorough check of the electrical system.

The manufacturer is not responsible for any damage caused by the lack of a suitable earthing system or by the malfunctioning of the electricity mains supply.

WIRING DIAGRAM FOR CONNECTION TO AN OPEN VENTED CYLINDER

* Terminals shown are for the MTS Unvented Hot Water Cylinder Thermostats

WIRING DIAGRAM FOR CONNECTION TO AN MTS UNVENTED CYLINDER

* Terminals shown are for the MTS Unvented Hot Water Cylinder Thermostats

Initial preparation

MTS (GB) Limited support the benchmark initiative. On pages 65 and 66 of this manual the Benchmark Commissioning Checklist and Service interval Record can be found. It is important that this is completed in the presence of your customer, they are shown how to use it, and it is signed by them. Please instruct your customer that they must have this manual with them whenever they contact a service engineer or us.

Preliminary electrical system checks to ensure electrical safety must be carried out by a competent person i.e. polarity, earth continuity, resistance to earth and short circuit.

Electricity supply

- Check that the voltage and frequency of the electricity supply correspond to the data shown on the boiler data plate;
- Make sure that the earthing connection is efficient.

Filling the Heating System:

Switch the electrical supply to the boiler on in order to view the system pressure on the display;

Remove the front casing panel and lower the control panel as described on page 13).

Open the central heating flow and return cocks supplied with the connection kit;

Lift the cap on the automatic air release valve and leave open permanently;

Close all air release valves on the central heating system;

Gradually open the valves at the filling point (filling loop) until water is heard to flow, do not open fully;

Open each air release tap starting with the lowest point and close them only when clear water free of air is visible;

Purge the air from the pump by unscrewing the pump plug anti-clockwise, also manually rotate the pump shaft in the direction indicated by the pump label to ensure the pump is free;

Refit the pump plug;

Continue filling the system until at least 1.5 bar registers on the pressure gauge;

Inspect the system for water soundness and remedy any leaks discovered.

IMPORTANT!

MANUALLY VENT THE HEAT EXCHANGER AT THE MANUAL AIR VENT. FAILURE TO VENT ADEQUATELY MAY DAMAGE THE HEAT EXCHANGER (PAGE 7, LEGEND 2).

Filling of the DHW System:

Close all hot water draw off taps;

Open the cold water inlet cock supplied with the connection kit;

Slowly open each draw off tap and close them only when clear water, free of bubbles, is visible.

Gas Supply:

Inspect the entire installation including the gas meter and test for soundness. The entire installation should be in accordance with the relevant standards. In GB this is BS 6891 and in IE this is the current edition of I.S.813.

The connection on the the appliance is a 15mm nut and olive located at the rear of the gas service cock.

If the gas supply serves other appliances, ensure that an adequate supply is available both to the boiler and the other appliances when they are in use at the same time.

Pipe work must be of an adequate size. Pipes of less than 22mm should not be used, final connection being 15mm.

Open the gas cock (supplied with the connection kit) to the appliance and check the gas connection on the appliance for leaks.

Water Treatment:

The boiler is equipped with a stainless steel heat exchanger.

The detailed recommendations for water treatment are given in BS 7593:1992 (Treatment of water in domestic hot water central heating systems); the following notes are given for general guidance;

If the boiler is installed on an existing system, any unsuitable additives must be removed;

Under no circumstances should the boiler be fired before the system has been thoroughly flushed; the flushing procedure must be in line with BS7593:1992.

Firstly fill the central heating system with the power off, and flush through cold, fill the central heating system again, adding a flushing detergent, run the boiler on central heating until it reaches its operating temperature and flush the system, refill the system with a suitable corrosion inhibitor,

NOTE: FAILURE TO CARRY OUT THE FLUSHING PROCEDURE WILL RESULT IN THE WARRANTY BECOMING VOID.

FIRST IGNITION OPERATION

Date

Installer

1. Check the electrical supply.

Complete

2. Check the type of gas and
change the gas if necessary.

Complete

3. Check the gas tightness.

Complete

4. Measure the gas inlet/
standing pressure

Complete

5. Check the flue installation.
(See Connecting the flue)

Complete

6. Fill the installation and
flush. See page 28

Complete

7. Check the hydraulic water
tightness.

Complete

8. Spin the pump.

Complete

9. Purge air by pressing ESC
button for 5 sec. & manually
vent the exchanger

Complete

10. Change the language in
the display (if necessary).
Page 33.

Complete

11. Set the hour, and the date.
See page 33

Complete

12. Set the heating power. See
page 33

Complete

13. Balance the central
heating circuit.

Complete

14. Measure the gas inlet
working pressure.

Complete

17. Explain to the end user the
working of the boiler and
controls

Complete

commissioning

Ignition procedure

Press the ON/OFF button on the control panel to switch on the boiler. The display shows:

The operating mode will be indicated by the three figures marked out on the diagram above.

The first figure indicates the operating mode:

- 0 XX - Stand-by, the scrolling text show the operation mode selected "summer" or "winter"
- C XX - "C.Heating active" - Central heating request
- c XX - "CH Pump Overrun" - Heating post-circulation
- b XX - DHW request (with storage cylinder connected)
- h XX - "DHW Pump Overrun" hot water post-circulation
- F XX - "Pump Frost Prot" - circulation pump anti-freeze protection enabled
- "Burn Frost Prot" - burner anti-freeze protection enabled

The second and third figures indicate:

- the flow temperature when no heating requests have been made
- the flow temperature in central heating mode
- the set temperature of the hot water in domestic hot water
- the flow temperature in anti-freeze mode.

The indication of certain functions:

P 1- "Purge in progress" = Deaeration cycle started

Electricity supply

- Check that the voltage and frequency of the electricity supply correspond to the data shown on the boiler data plate;
- Make sure that the earthing connection is efficient.

menu 2 - Boiler parameters

submenu 3 - parameter 1

Maximum Heating Power adjustment

submenu 2 - parameter 0

Soft light Ignition

submenu 3 - parameter 5

Heating ignition delay

First ignition

1. Make sure that:

- The gas valve is closed;
- The electrical connection has been properly carried out. Make sure that, in any case, the green/yellow earthing wire is connected to an efficient earthing system;
- Use a screwdriver to lift the cap on the automatic air relief valve;

- Switch on the boiler (by pressing the ON/OFF button) and use the MODE button to select the standby mode, where no hot water or heating requests are made.
 - Start the deaeration cycle by pressing Esc for 5 seconds. The boiler will start a deaeration cycle lasting about 7 minutes (See below). If you need to stop it press Esc, alternatively it is possible to manually vent the heat exchanger.
 - At the end, check that the system is completely deaerated and, if not, repeat the procedure.
 - Bleed the air from the radiators;
 - The exhaust duct for combustion products should be suitable and free from any obstructions;
 - Any necessary ventilation inlets in the room should be open (type B installation).
2. Open the gas cock and check the connection seals, including the boiler connection joints, making sure that the meter does not detect any passage of gas. Eliminate any leaks.
3. Start the boiler by selecting the heating or domestic hot water operation using the MODE button.

Description of Function

Deaeration cycle

During the filling stage or if there is excess air in the system, the deaeration cycle can be activated by holding the Esc button for 5 seconds. The boiler will start a cycle which lasts approximately 7 minutes. When this is complete the menu screen will be restored. The cycle may either be repeated, if necessary, or stopped by pressing Esc. Press the Esc button until the normal display screen is restored. **IF THE CYCLE IS STOPPED BE SURE TO MANUALLY VENT THE APPLIANCE USING THE MANUAL VENT ON THE PRIMARY HEAT EXCHANGER (SEE PAGE 2, KEY NUMBER 2).**

Failure to adequately vent the boiler could result in damage to the appliance. In this event, the warranty will become void.

Maximum Heating Power adjustment

The maximum heating power can be adjusted to between the maximum power allowed by the boiler and the minimum power).

The display shows the value between 100% ("99" on the display) and 0% ("0") of this interval.

To check the maximum heating power, access menu 2/sub menu 3/parameter 1, check the value and, if necessary, modify it as indicated in the Gas Regulation table. (See below)..

Checking slow ignition power

The soft light can be adjusted between the maximum power (shown on the display as "99", i.e. 100%) and the minimum power (shown on the display as "1", i.e. 1%).

To check the slow ignition power, access menu 2/sub menu 2/parameter 0.

Heating ignition delay adjustment

This parameter – menu 2/sub menu 3/parameter 5 - can be used to manually (0) or automatically (1) set the delay time before the subsequent reignition of the burner after it has switched off on reaching the desired temperature in central heating mode.

By selecting manual, it is possible to set the delay in minutes using the successive parameter (menu 2/sub menu 3/parameter 6), to a time between 0 and 7 minutes.

Automatic selection means that the boiler will establish the delay time based on the set-point temperature.

Gas setting									
	parameter	18 kW		24 kW		30 kW			
		G20	G31	G20	G31	G20	G31		
lower Wobbe index (15°C, 1013 mbar) (MJ/m ³)		45,67	70,69	45,67	70,69	45,67	70,69		
minimum fan speed(%)	233	02	02	05	05	01	01		
maximum central heating fan speed (%)	234	80	80	85	85	80	80		
maximum D.H.W fan speed (%)	232	/	/	98	98	89	89		
gas valve restrictor(ø)		NO	3,80	NO	3,80	NO	4,50		
gas flow max/min (15°C, 1013 mbar) (nat - m ³ /h) (GPL - kg/h)	max D.H.W	/	/	2,65	1,94	3,17	2,33		
	max C.H.	1,90	1,40	2,33	1,71	2,96	2,17		
	min	0,48	0,35	0,58	0,43	0,69	0,50		

commissioning

Test function and combustion analysis

The boiler has two pressure taps to measure the combustion gas temperature, the combustive air and the concentrations of O₂ and CO₂ on the outside of the flue gas header. to access these pressure taps, unscrew the screw which holds the blanking cover and its seal together.

Checking the gas setting

To carry out analyses of combustion, the test function must be activated.

Test function

The PCB allows the appliance to be forced to minimum or maximum power.

Activate the cleaning function by pressing the **Reset** button for 5 seconds, the boiler switches to maximum heating power, the following appears on the display:

To select the test function at maximum domestic hot water, press the **+** button, the following appears on the display :

To select the function at minimum domestic hot water, press the **-** button, the following appears on the display :

The function is automatically deactivated after 10 minutes or by pressing the **Reset** button.

Note: the appliance can be forced to minimum or maximum power from menu 7 (see the section on the display - setting - diagnostics menu).

Maximum gas flow combustion analysis

Activate the test function at the maximum heating power t⁺

Wait for the boiler to stabilise before carrying out the combustion analyses. Check the CO₂ value according to the table below. Important: do not remove silencer **22**

Maximum or minimum CO ₂	18 kW	24 kW	30 kW
	CO ₂ (%)		
G20	9.0 ± 0.2	9.0 ± 0.2	9.0 ± 0.2
G31	10.7 ± 0.2	10.7 ± 0.2	10.0 ± 0.2

N.B.: when the front combustion chamber panel is open, the CO₂ value drops by 0.3%.

If the values taken differ from the table, adjust the gas valve following the procedure described below.

Adjust the CO₂ content to **± 0.2** by turning setting screw **50** (**2.5 mm allen key**)

- tighten to lower the CO₂ value
- unscrew to increase the CO₂ value

Set the content by turning the screw about a 1/4 of a turn then wait after each change for approximately 1 minute for the CO₂ value to stabilise, then repeat.

Minimum gas flow combustion analysis

Activate the cleaning function at minimum power in either heating or domestic hot water production.

Wait for the boiler to stabilise before carrying out the combustion analyses. Check the CO₂ value according to the table above.

Important: do not remove silencer

N.B.: when the combustion chamber is open, the CO₂ value drops by 0.3%.

If the values taken differ from the table, adjust the gas valve following the procedure described below.

To adjust the CO₂ value, remove cap **2**, adjust the CO₂ content to **± 0.2** by turning setting screw **51** (**4 mm allen key**)

- unscrew to lower the CO₂ value
- tighten to increase the CO₂ value

Set the content by turning the screw about a 1/4 of a turn then wait after each change for approximately 1 minute for the CO₂ value to stabilise, then repeat.

Once the settings and analyses are complete, exit test mode, and reposition the blanking cover and its seal correctly.

AUTO function

This is a function which enables the boiler to automatically adapt its operation routine (the temperature of the heating elements) in line with the outdoor conditions, in order to achieve and maintain the requested room temperature conditions.

Depending on the peripheral units connected and the number of zones controlled, the boiler adjusts its flow temperature automatically.

The various corresponding parameters should therefore be set (see adjustments menu).

To activate the function, press the **AUTO** button.

Example 1:

SINGLE ZONE SYSTEM (HIGH-TEMPERATURE) WITH ON/OFF ROOM THERMOSTAT:

In this case the following parameters must be set:

- 4 21 - Activation of temperature adjustment using sensors
 - Select 04 = Basic temperature adjustment
- 2 44 - Boost Time (optional)
 - The wait time for the flow temperature increase in steps of 4°C may be set. The value varies according to the type of system and installation.
 - If the Boost Time value = 00 the function is not activated.

Example 2:

SINGLE ZONE SYSTEM (HIGH-TEMPERATURE) WITH ON/OFF ROOM THERMOSTAT + OUTDOOR SENSOR:

In this case the following parameters must be set:

- 4 21 - Activation of temperature adjustment using sensors
 - Select 01 = outdoor sensor only
- 4 22 - Temperature adjustment curve selection
 - Select the relevant curve according to the type of system, installation, heat insulation used in the building, etc.
- 4 23 - Perform a parallel curve shift if necessary, increasing or decreasing the set-point temperature (this may also be modified by the user, using the heating temperature adjustment knob, which, with the Auto function activated, is used to shift the curve in a parallel manner).

Example 3:

SINGLE ZONE SYSTEM (HIGH-TEMPERATURE) WITH REMOCON REMOTE CONTROL + OUTDOOR SENSOR

In this case the following parameters must be set:

- 4 21 - Activation of temperature adjustment using sensors
 - select 0 = outdoor sensor + room sensor
- 4 22 - Temperature adjustment curve selection
 - Select the relevant curve according to the type of system, installation, heat insulation used in the building, etc
- 4 23 - Perform a parallel curve shift if necessary, increasing or decreasing the set-point temperature. (This may also be changed by the user by the encoder which, with the Auto function activated, is used to shift the curve in a parallel manner.)
- 4 24 - Influence of room sensor
 - used to adjust the influence the room temperature has on the calculation of the set-point flow temperature (20 = maximum, 0 = minimum).

Note: See page 33 for details on accessing menus.

boiler protection devices

Boiler protection devices

The boiler is protected from malfunctioning by means of internal checks performed by the electronic microprocessor P.C.B., which stops the boiler from operating if necessary.

In the event of the boiler being shut off in this manner, a code appears on the display which refers to the type of shut-off and the reason behind it.

There are two types of shut-off:

Safety shut-off

This type of error is "volatile", which means that the boiler starts up again automatically as soon as the problem which caused the shut-off is removed; the error is indicated by the «Err» symbol which appears on the display and the error code.

In fact, soon as the cause of the shut-off disappears, the boiler starts up again and continues to operate normally.

In the event of error **1 08 - Shut-off due to insufficient water pressure** inside the heating circuit - the boiler will perform a safety shut-off.

You can increase the pressure by filling the heating circuit.

In this case or if the re-balancing request is performed on a frequent basis, switch the boiler off, turn the external electric switch to the OFF position, shut off the gas cock and contact a qualified technician to check for any leaks of water.

Shutdown

This type of error is "non-volatile", which means that it is not removed automatically. To restore normal operation press the **Reset** button on the control panel.

The first figure of the error code (e.g. 1 01) indicates within which operational assembly the error occurred.

- 1 - Primary Circuit
- 2 - Domestic Hot Water Circuit
- 3 - Internal Electronic Part
- 4 - External Electronic Part
- 5 - Ignition and Detection
- 6 - Air inlet - flue gas outlet

Malfunction warning

This warning is shown by the display in the following format:

5 P1 = FIRST IGNITION ATTEMPT UNSUCCESSFUL

the first figure indicating the operational assembly is followed by a P (warning) and the code relating to the specific warning.

Important

If this shutdown occurs frequently, contact an authorised Technical Service Centre for assistance. For safety reasons, the boiler will permit a maximum of 5 resets in 15 minutes (5 presses of the RESET button); at the 6th attempt within this 15-minute period the boiler will shut down and may only be operated again after the electricity supply has been disconnected. If the shutdown is occasional or an isolated event, this is not a problem.

Anti-frost Device.

The anti-frost function acts on the central heating flow temperature probe, independently from other regulations, when the electrical supply is turned on.

If the primary circuit temperature is between 3°C and 8°C the pump will run (with the diverter valve switching between central heating and hot water every 1 minute) until the temperature reaches > 9°C.

If the flow temperature remains between 3°C and 8°C the pump will continue to run for a maximum of 20 minutes unless a temperature above > 9°C is detected in the central heating flow, after this the burner will fire (heating position) until a temperature of > 30°C is detected.

If the central heating flow temperature is < 3°C, the burner will fire (heating position) at minimum power until the temperature reaches > 30°C, the burner will go out.

If lockout is caused by overheat the burner will not fire but the pump will continue to run (heating position).

The anti-frost device activates only when (with the boiler operating correctly):

- the system pressure is correct;
- the boiler is electrically powered;
- there is a supply of gas.

Table summarising error codes

Central Heating circuit	
Display	Description
1 0 1	Overheat
1 0 2	Pressure Sens Error
1 0 3	Insufficient circulation
1 0 4	
1 0 5	
1 0 6	
1 0 7	System pressure > 3 bar
1 0 9	
1 1 0	
1 0 8	
1 1 2	C.H. Return temp. probe circuit open / short circuit
1 1 4	External sensor circuit open / short circuit
1 1 6	Floor Thermostat contact open
1 1 8	Heating delivery probe problem
1 P 1	Insufficient circulation indication
1 P 2	
1 P 3	
1 P 4	Insufficient water (request filling)
1 P 5	Filling incomplete
1 P 6	Filling incomplete
1 P 7	Too many refills (+ 5 in 50 min)
1 P 8	Too many refills (+ 5 in 7 days)
Internal P.C.B.'s	
3 0 1	EEPROM error
3 0 2	Communication error
3 0 3	Main P.C.B. error
3 0 4	Too many (> 5) resets in 15 minutes
3 0 5	Main P.C.B. error
3 0 6	Main P.C.B. error
3 0 7	Main P.C.B. error
External P.C.B.'s	
4 0 7	Room sensor circuit open 7 short circuit
Ignition and Detection	
5 0 1	No flame detected
5 0 2	Flame detected with gas valve closed
5 P 1	1st Ignition Failed
5 P 2	2nd Ignition Failed
5 P 3	Flame cut-off
5 P 4	3 flame cut-offs detected in one cycle
Air Inlet / Flue gas outlet	
6 0 4	Insufficient fan speed
6 1 0	Thermofuse open

Accessing the settings - adjustment - problem identification menus

The boiler can be used to manage the heating and domestic hot water production system in its entirety.

Navigation within the menus enables the boiler system + connected peripheral units to be customised, optimising operation for maximum comfort and maximum saving. It also provides important information relating to the efficient operation of the boiler.

The following menus are available:

2	Boiler Parameter
2 1	Service code (234)
2 2	General setting
2 3	C.H. Parameters - Part 1
2 4	C.H. Parameters - Part 1
2 5	Domestic Hot Water
2 9	Menù 2 Reset to factory setting
3	Solar & Storage
3 0	General setting
3 1	Service code (234)
3 2	Special setting
4	Zone 1 Parameters
4 0	Set-point Zone1
4 1	Service code (234)
4 2	Zone 1 Setting
4 3	Diagnostics
4 4	Zone device mangement
5	Zone 2 Parameters
5 0	Set-point Zone2
5 1	Service code (234)
5 2	Zone 2 Setting
5 3	Diagnostics
5 4	Zone device mangement
5 5	Multizone
7	Test & Utilities
8	Service Parameter
8 1	Service code (234)
8 2	Boiler
8 3	Boiler Temperature
8 4	Solar & Storage
8 5	Service
8 6	Statistics
8 7	E@sy - NOT ACTIVE
8 8	Error History

The parameters relating to each individual menu are listed in the following pages.

The various parameters can be accessed and modified using th MENU/OK button and programmation buttons (+) and (-). (see fig. below).

To access the Menus, open the cover and proceed as follows:

1. Press the MENU/OK button; the first figure @00 will flash on the display.
2. Press the buttons (+) or (-) to select a menu, for example: "200"
3. Press the MENU/OK button; the second figures on the display will flash, e.g. "210".

Caution! The menus reserved for qualified technicians may only be accessed after setting the access code.

4. Press the MENU/OK button; 222 will appear on the display unit.
5. Press the buttons (+) or (-) to select code 234
6. Press the MENU/OK button to select the sub menu; the second figures will flash, e.g. "220".
7. Press the buttons (+) or (-) to select a sub menu; for example: "230"
8. Press the MENU/OK button to access the sub menu parameters; the three figures will flash, for example: "231".
9. Press the buttons (+) or (-) to select a parameter; for example: "231"
10. Press the MENU/OK button to access the parameter; the display will indicate the value, e.g. "10".

Note: The parameter value will be displayed for 20 seconds, then will begin to flash in alternation with the parameter, e.g. "10 > 231".

11. Press the buttons (+) or (-) to select the new value, e.g. "15".
12. Press MENU/OK to save the change or press Esc to exit without saving.

To exit, press the Esc button until the normal display screen is restored.

For menus which do not require the access code, it is possible to pass directly from the menu to the sub menu.

settings - adjustment - problem identification menus

menu	sub-menu	parameter	description	value	default setting	
2			BOILER PARAMETER SETTING			
2	1		Entering access code		222	press the programming "+" button to select 234 and press the MENU button
2	2		BOILER GENERAL SETTING			
2	2	0	Slow ignition	0 to 99	60	RESERVED FOR SAT
2	2	1	Minimum ambient temperature for antifreeze activation	from 2 to 10 °C	5	Activated only with the modulating peripheral device (optional)
2	2	2	NOT PRESENT			
2	2	3	Underfloor thermostat or zone 2 ambient thermostat selection	0 = Floor safety thermostat 1 = Zone 2 ambient thermostat	0	
2	2	4	Mechanical timer connection authorisation	0 = Absent 1 = Present	0	to be modified if mechanical timer is present (optional)
2	2	5	Heating ignition delay	0 = Deactivated 1 = 10 seconds 2 = 90 seconds 3 = 210 seconds	0	Activated only with zone 2 interface (optional)
2	2	6	NOT PRESENT			
2	2	7	Flue gas sensor authorisation CANNOT BE MODIFIED	0 = Deactivated 1 = Activated	0	RESERVED FOR TECHNICAL ASSISTANCE Only if the PCB is changed
2	2	8	Boiler Version CANNOT BE MODIFIED	0 to 5	0	RESERVED FOR TECHNICAL ASSISTANCE Only if the PCB is changed
2	3		BOILER PARAMETER - PART 1			
2	3	0	NOT PRESENT			
2	3	1	Maximum heating power setting	0 to 99		see the "gas setting" table, information on page 30
2	3	2	Domestic hot water maximum RPM percentage CANNOT BE MODIFIED	0 to 99		RESERVED FOR TECHNICAL ASSISTANCE Only if the gas or PCB is changed see "gas setting" table
2	3	3	Minimum RPM percentage CANNOT BE MODIFIED	0 to 99		
2	3	4	Heating maximum RPM percentage CANNOT BE MODIFIED	0 to 99		
2	3	5	Selection of ignition delay type when heating	0 = Manual 1 = automatic	1	see section on "gas setting"
2	3	6	Ignition delay when heating timer setting	from 0 to 7 minutes	3	
2	3	7	Post-circulation when heating	from 0 to 15 minutes or continuous	3	
2	3	8	Circulation pump operating type	0 = Low Speed 1 = High Speed 2 = Modulating	2	
2	3	9	Setting the Delta T Circulation pump modulation	from 10 to 30 °C	20	to be set with operation of the circulation pump in modulating mode
			These parameters allow the flow and return temperature difference to be set, which determines whether the circulation pump switches from low to high speed E.g.: param. 239 = 20 and $\Delta T > 20^{\circ}\text{C}$ - the circulation pump runs at high speed. If $\Delta T < 20 - 2^{\circ}\text{C}$ the circulation pump runs at low speed. The minimum waiting time for changing speed is 5 minutes.			

settings - adjustment - problem identification menus

menu	sub-menu	parameter	description	value	default setting	
2	4		BOILER PARAMETER - PART 2			
2	4	0	NOT PRESENT			
2	4	1	NOT PRESENT

8	8	0	10 last errors	from E00 to E99		
			<p>This parameter allows the last 10 boiler errors flagged to be displayed, indicating the day, month and year. When the parameter is accessed, the errors are displayed listed from E00 to E99. For each error, the following sequence is displayed: E00 - error number 108 - error code A15 - A = day on which error E00 occurred B09 - B = month during which error E00 occurred C06 - C = year during which error E00 occurred</p>			
8	8	1	Error list reset	Reset OK = yes ESC = no		

Important

Maintenance is an essential part of the safe and efficient operation of the boiler and ensures its durability. It should be performed according to the instructions given in current legislation. Perform combustion analysis regularly in order to check the operating efficiency of the boiler and to make sure any polluting substances released are within the boundaries set by current legislation.

Before beginning maintenance work:

- Disconnect the appliance from the electricity supply by turning the external bipolar switch to the "OFF" position;
- Close the gas valve and the central heating and domestic hot water system valve.

After the work has been completed the initial settings will be restored.

General comments

It is recommended that the following inspections be carried out on the boiler at least once a year:

1. Check the seals in the water part and, if necessary, replace the gaskets and restore the seal to perfect working order.
2. Check the seals in the gas part and, if necessary, replace the gaskets and restore the seal to perfect working order.
3. Visually check the overall condition of the boiler.
4. Visually check the combustion and, if necessary, disassemble and clean the burner.
5. Cleaning the primary heat exchanger
6. Make sure the following heating safety devices are operating correctly:
 - temperature limit safety device.
7. Make sure that the following gas part safety devices are operating correctly:
 - absence of gas or flame safety device (ionisation).
8. Perform a general inspection of the boiler operation.
9. Remove oxide from the detection electrode using an emery cloth.
10. These checks are not exhaustive. Further mechanical, electrical and combustion maintenance checks may be required.

Operational test

After having carried out the maintenance operations, fill the heating circuit at a pressure of approximately 1.0 bar and release the air from the system.

- Begin operating the boiler.
- If necessary, release the air from the heating system again.
- Check the settings and make sure all the command, adjustment and monitoring parts are working correctly.
- Check the flue system is sealed and operating correctly.

Draining procedures

The heating system must be drained using the following procedure:

- Switch off the boiler, make sure the external bipolar switch is in the OFF position and shut off the gas valve;
- Loosen the automatic air relief valve;
- Open the system drain off cock and collect the escaping water in a container;
- Empty the water from the lowest points of the system (where applicable).

If the system is to be left inactive in areas where the room temperature may fall below 0°C during winter, we recommend that anti-freeze liquid is added to the water in the heating system in order to avoid the need for repeated draining; when this liquid is used make sure it is compatible with the stainless steel used for the bodywork of the boiler.

We recommend the use of anti-freeze products which contain PROPYLENE GLYCOLS as these inhibit corrosion and that they are used in conjunction with the anti-scaling and anti-corrosion function, in the quantities suggested by the manufacturer, at the minimum temperature.

Regularly check the pH level of the water/anti-freeze mix in the boiler circuit and replace it when the value measured is lower than the limit prescribed by the manufacturer.

DO NOT MIX DIFFERENT TYPES OF ANTI-FREEZE.

The manufacturer will not be held liable for any damage caused by the appliance or the system due to the use of inappropriate anti-freeze substances or additives.

WARNING

Before handling, empty all components which may contain hot water, bleed where necessary.

Descale the components in accordance with the instructions provided on the safety data leaflet supplied with the product used, make sure the room is well ventilated, wear protective clothing, avoid mixing different products, and protect the appliance and surrounding objects.

Seal all openings used to take a gas pressure reading or to make any gas adjustments.

Make sure that the nozzle is compatible with the supplied gas.

If a smell of burning is detected or smoke is seen leaking from the appliance, or there is a smell of gas, disconnect it from the electricity supply, shut off the gas valve, open the windows and call for technical assistance.

1. GENERAL ACCESS

1.3 GENERAL ACCESS

GENERAL ACCESS			
Tools		Time	 3 min
1	 Unclip the cover to remove	 Remove the two screws	 Remove the front panel
2	 Lower the electrical box	 Remove the combustion chamber front panel by releasing the clips	

2. ELECTRICAL UNIT

2.1 CONTROL BOX ACCESS

CONTROL BOX ACCESS			
Tools			Time  4 min
1	 Remove the front panel as above and pivot the electrical box	 Remove the two screws and unlock the four clamps to gain access to the control box

Dear Customer,

Thank you for choosing an ARISTON boiler.
We guarantee that your boiler is a reliable and technically sound product.
This manual provides detailed instructions and recommendations for proper installation, use and maintenance.
Remember to keep this manual in a safe place for future reference i.e. by the gas meter.
Your local MTS Servicing Centre is at your complete disposal for all requirements.

The installation and first ignition of the boiler must be performed by qualified personnel in compliance with current national regulations regarding installation, and in conformity with any requirements established by local authorities and public health organisations.
After the boiler has been installed, the installer must ensure that the end user receives the declaration of conformity and the operating manual, and should provide all necessary information as to how the boiler and the safety devices should be handled.

This appliance should be connected to a heating system and possibly a distribution network for domestic hot water, both of which must be compatible with its performance and power levels. The use of the appliance for purposes other than those specified is strictly forbidden. The manufacturer cannot be held responsible for any damage caused by improper, incorrect and unreasonable use of the appliance or by the failure to comply with the instructions given in this manual.

Installation, maintenance and all other interventions must be carried out in full conformity with the governing legal regulations and the instructions provided by the manufacturer. Incorrect installation can harm persons, animals and possessions; the manufacturing company shall not be held responsible for any damage caused as a result.

In the event of any maintenance or other structural work in the immediate vicinity of the ducts or flue gas exhaust devices and their accessories, switch the appliance off by switching the external bipolar switch to the "OFF" position and shutting off the gas valve. When the work has been completed, ask a qualified technician to check the efficiency of the ducting and the devices.

If the boiler should be out of use for a prolonged period, it is recommended that the electrical power supply be disconnected and that the external gas cock be closed. If low temperatures are expected, the boiler and system pipe work should be drained in order to prevent frost damage.

Turn the boiler off and turn the external switch "OFF" to clean the exterior parts of the appliance.

Do not allow children or inexperienced persons to use the appliance without supervision.

CE labelling

The CE mark guarantees that the appliance conforms to the following directives:

- **90/396/CEE**
relating to gas appliances
- **89/336/CEE**
relating to electromagnetic compatibility
- **92/42/CEE**
relating to energy efficiency
- **73/23/CEE**
relating to electrical safety

GUARANTEE

The appliance is guaranteed for 24 months from the date of purchase.

Aristons only obligation under the guarantee will be to repair or replace the faulty appliance at Aristons discretion. This will be carried out where the fault arises from within defects in the appliance, caused either by material or workmanship of the manufacturer.

This guarantee does not protect malfunction or damage arising from incorrect installation, commissioning or maintenance procedures as laid out in the installation and servicing manual, inefficient flue system, poor or incorrect electricity, wrong gas supply or pressure, tampering by inexperienced persons and any other cause not directly due to manufacture.

MTS (GB) Limited cannot accept responsibility for any cost arising from repair or maintenance carried out by any third party.

Service under the guarantee does not affect the expiry date of the guarantee. The guarantee on parts and appliances which are exchanged ends when the guarantee on the original appliance expires.

This guarantee does not affect your statutory rights.

You must have your boiler serviced at the end of the first year to validate your guarantee for the second year.

Safety regulations

Key to symbols:

-  Failure to comply with this warning implies the risk of personal injury, in some circumstances even fatal
-  Failure to comply with this warning implies the risk of damage, in some circumstances even serious, to property, plants or animals.
- Do not perform operations which involve opening the appliance.**
-  Electrocutation from live components.
Personal injury caused by burns due to overheated components, or wounds caused by sharp edges or protrusions.
- Do not perform operations which involve removing the appliance from its installation space.**
-  Electrocutation from live components.
-  Flooding caused by water leaking from disconnected piping.
Explosions, fires or intoxication caused by gas leaking from disconnected piping.
- Do not damage the power supply cable.**
-  Electrocutation from live uninsulated wires.
- Do not leave anything on top of the appliance.**
-  Personal injury caused by an object falling off the appliance as a result of vibrations.
Damage to the appliance or items underneath it caused by the object falling off as a result of vibrations.
- Do not climb onto the appliance.**
-  Personal injury caused by the appliance falling.
Damage to the appliance or any objects underneath it caused by the appliance falling away from its installation space.
- Do not climb onto chairs, stools, ladders or unstable supports to clean the appliance.**
-  Personal injury caused by falling from a height or cuts (step ladders shutting accidentally).
- Do not attempt to clean the appliance without first switching it off and turning the external switch to the OFF position.**
-  Electrocutation from live components.
- Do not use insecticides, solvents or aggressive detergents to clean the appliance.**
-  Damage to plastic and painted parts.
- Do not use the appliance for any use other than normal domestic use.**
-  Damage to the appliance caused by operation overload.
Damage caused to objects treated inappropriately.
- Do not allow children or inexperienced individuals to operate the appliance.**
-  Damage to the appliance caused by improper use. **If you detect a smell of burning or smoke coming from the appliance, disconnect it from the electricity supply, turn off the main gas valve, open all windows and call for assistance.**
-  Personal injury caused by burns, smoke inhalation, intoxication. **If there is a strong smell of gas, turn off the main gas valve, open all windows and call for assistance.**
-  Explosions, fires or intoxication.

Auto Function

The AUTO function serves to optimise boiler performance, while maintaining an optimum radiator temperature and maximum user comfort. It ensures the building stays at the ideal temperature, whilst saving energy.

The principle is that the water temperature at the boiler outlet is automatically adjusted, depending on the interior ambient temperature.

Control Panel

Legend :

- | | |
|--|--|
| 1. Display | 10. Time clock (Optional) |
| 2. RESET button | 11. ON/OFF button |
| 3. Red indicator lockout light | 12. Blue indicator burner ON |
| 4. Pressure gauge | 13. GREEN indicator AUTO function |
| 5. Heating temperature regulation knob | 14. AUTO button (To activate Thermoregulation) |
| 6. button - | |
| 7. MENU/OK button (Programming key) | |
| 8. ESC button | |
| 9. button + | |

Initial operating procedures

If the boiler is installed inside the apartment, make sure that all provisions relating to the air inlet and room ventilation (in compliance with current legislation) are respected. Check the water pressure on the display regularly and make sure that the figure is between 0.6 and 1.5 bar when the system is cold. If the pressure is just under the minimum value the display will request a filling procedure.

To re-pressurise the boiler, it will be necessary to connect the silver flexible hose supplied to the two isolating points underneath the boiler, once the hose is connected, open up both of the black quarter turn handles, once the pressure reads 1.5 bar on the display, close both handles and disconnect the hose.

If the pressure drops very frequently, there may be a water leak at some point in the system. If this is the case please contact your installer and ask them to check it.

If the pressure drops very frequently, there may be a water leak at some point in the system. If this is the case a plumber should be contacted.

Ignition procedure

Press the ON/OFF button on the control panel to switch on the boiler. The display shows:

The first figure indicates the operating mode:

- 0 - Stand-by,
- C - Central heating request
- c - Heating post-circulation
- H - Hot water post-circulation
- F - Circulation pump anti-freeze protection enabled
- burner anti-freeze protection enabled

The second and third figures indicate:

- the flow temperature when no heating requests have been made
- the flow temperature when the boiler is operating
- the flow temperature in anti-freeze mode.

Adjusting the heating

It is possible to set the temperature of the heating water by adjusting the knob **6**. By placing the indicator somewhere between min. and max. a temperature may be obtained which varies from about 20°C to about 45°C (low temperature) and about 35°C to about 82°C (high temperature).

Switching off the heating

To switch off the heating mode turn the button **6** in the position

○

Stand by

To switch off the boiler press the ON/OFF **13**.

Switch off the boiler completely by switching the external electrical switch to the OFF position; the display will switch off.

Close the gas tap.

Appliance shut-off conditions

The boiler is protected from malfunctions by means of internal checks performed by the electronic P.C.B., which stops the boiler from operating if necessary. In the event of the boiler being shut off in this manner, a code appears on the control panel display which refers to the type of shut-off and the reason behind it.

Two types of shut-off may occur:

Safety shut-off

This type of error is "volatile", which means that the boiler starts up again automatically as soon as the problem which caused the shut-off is removed. The display will flash "Err" and the error code.

In fact, as soon as the cause of the shut-off disappears, the boiler starts up again and continues to operate normally.

While the boiler is shut off for safety reasons, it is possible to attempt to restore normal operation by switching the appliance off and on again using the ON/OFF button on the control panel.

If the boiler still indicates a safety shut-off, switch it off. Make sure the external electric switch is in the OFF position, close the gas tap and contact a qualified technician.

Safety shut-off due to insufficient water pressure

If the water pressure inside the heating circuit is insufficient, the boiler will perform a safety shut-off. (See table).

Operation shutdown

This type of error is "non volatile", which means that it is not removed automatically. The display will flash ERR and the error code and the red led lights up "3" .

In this case the boiler does not restart automatically, but it may be reset by pressing the **Reset** button. If the problem manifests itself again after several attempts to reset the appliance, contact a qualified technician.

IMPORTANT

IF THIS SHUTDOWN OCCURS FREQUENTLY, CONTACT AN AUTHORISED SERVICE CENTRE FOR ASSISTANCE. FOR SAFETY REASONS, THE BOILER WILL ALLOW A MAXIMUM OF 5 RESET OPERATIONS TO TAKE PLACE IN 15 MINUTES (INDIVIDUAL PRESSES OF THE **Reset BUTTON).**

Maintenance

Schedule an annual maintenance check-up for the boiler with a competent person.

Correct maintenance always results in savings in the cost of running the system.

Failure to arrange an annual service for the appliance will invalidate the second year of the manufacturers guarantee.

Operation shutdown error table

Display	Description
1 01	Overheating
5 01	No flame detection
1 03	Insufficient circulation
1 04	
1 05	
1 06	
1 07	
3 05	P.C.B error
3 06	P.C.B error
3 07	P.C.B error

Anti-frost Device.

The anti-frost function acts on the central heating flow temperature probe, independently from other settings, when the electrical supply is turned on.

If the primary circuit temperature falls below 8°C the pump will run for 2 minutes.

After the two minutes of circulation (fixed) the boiler will check the following:

- if the central heating flow temperature is > 8°C, the pump stops;
- if the central heating flow temperature is between 4 and 8°C, the pump will run for another two minutes;
- if the central heating flow temperature is < 4°C, the burner will fire (heating position) at minimum power until the temperature reaches 33°C, the burner will go off and the pump will continue to run for two minutes.

The anti-frost device activates only when (with the boiler operating correctly):

- the system pressure is correct,
- the boiler is electrically powered,
- there is a supply of gas.

Auto button - Temperature adjustment activation

The AUTO function enables boiler operation to be adapted to environmental conditions and to the type of system it is installed on.

Comfortable temperature is reached inside the room in the quickest way possible, without wasting money, energy or efficiency, while substantially reducing the amount of wear experienced by the components.

Your installer will advise you on the devices connectable to the boiler and will program it according to the system.

In normal boilers the water temperature inside the heating elements is usually set to a high value (70-80°C), thereby ensuring effective heating during the few really cold winter days. It then becomes excessive on less cold days (of which there are many) more typical of the autumn and winter seasons. This leads to excessive room heating after the thermostat has been switched off, resulting in energy waste and uncomfortable conditions inside the room.

The AUTO function "takes control" of the boiler and selects the best operating regime based on environmental conditions, external devices connected to the boiler and the performance required. It constantly decides at which power level to operate based on the environmental conditions and the room temperature required.

Setting the Mechanical Clock

General layout

The Mechanical clock covers a 24 hour period. Each tappet represents 15 minutes **A**. An override switch is located on the clock **B**.

To set the time

To set the time of day, grasp the outer edge of the dial and turn slowly clockwise until the correct time is lined up with the arrow **C**.

To set the "On" and "Off" times

The clock uses a 24 hour system. e.g. 8 = 8:00 am and 18 = 6:00 pm "ON" periods are set by sliding all tappets between the "ON" time and the "OFF" time to the outer edge of the dial. The tappets remaining at the centre of the dial are the "OFF" periods.

For operation

Put the selector switch **B** to the ☰ symbol to control the central heating by the clock. Put the switch **B** to **I** to select permanent operation or to **0** to turn the central heating off permanently.
